

EXERCISE 12

Intro to Constraints; NOT NULL and UNIQUE Constraints

Global Fast Foods has been very successful this past year and has opened several new stores. They need to add a table to their database to store information about each of their store's locations. The owners want to make sure that all entries have an identification number, date opened, address, and city and that no other entry in the table can have the same email address. Based on this information, answer the following questions about the global_locations table. Use the table for your answers.

4)

Global Fast Foods global_locations Table						
NAME	TYPE	LENGTH	PRECISION	SCALE	NULLABLE	DEFAULT
id	NUMBER	4			NOT NULL	
name	VARCHAR2	20			NOT NULL	
date_opened	DATE	-			NOT NULL	
address	VARCHAR2	30			NOT NULL	
city	VARCHAR2	20			NOT NULL	
zip/postal code	VARCHAR2	20			NULLABLE	
phone	VARCHAR2	15			NULLABLE	
email	VARCHAR2	80			NOT NULL	
manager_id	VARCHAR2	4			NULLABLE	
Emergency contact	VARCHAR2	40			NULLABLE	

- What is a "constraint" as it relates to data integrity?

As constraint is a rule enforced on data in a database to maintain data integrity and accuracy. It ensures that only valid data is entered into table.
- What are the limitations of constraints that may be applied at the column level and at the table level?

Column level constraints can only be applied to a single column when the column is defined. Table-level constraints can refer to multiple columns.
- Why is it important to give meaningful names to constraints?

i) Identify the purpose of the constraint easily.
 ii) Simplify debugging or when an error message references the constraint.
 iii) Maintain clarity in large databases.
- Based on the information provided by the owners, choose a datatype for each column. Indicate the length, precision, and scale for each NUMBER datatype.

- Use "(nullable)" to indicate those columns that can have null values.

⇒ zip/postal code (nullable).
 ⇒ phone (nullable).
 ⇒ manager_id (number).
 ⇒ emergency contact (num).

6. Write the CREATE TABLE statement for the Global Fast Foods locations table to define the constraints at the column level

```
CREATE TABLE global_locations (id NUMBER). PRIMARY KEY,
name VARCHAR2(20) NOT NULL,
date_opened DATE NOT NULL,
address VARCHAR2(80) NOT NULL,
city VARCHAR2(20) NOT NULL,
zip_postal VARCHAR2(20),
Phone VARCHAR2(15),
email VARCHAR2(80) UNIQUE,
Manager_id NUMBER(4),
CONSTRAINT PK_global_locations_id PRIMARY KEY(id);
```

7. Execute the CREATE TABLE statement in Oracle Application Express.

You would own the above code in SQL commands or SQL Workshop inside Oracle apex. (Just type & click run)

8. Execute a DESCRIBE command to view the Table Summary information.

DESC global_locations;
This command displays the column names, data types and nullability.

9. Rewrite the CREATE TABLE statement for the Global Fast Foods locations table to define the UNIQUE constraints at the table level. Do not execute this statement.

NAME	TYPE	LENGTH	PRECISION	SCALE	NULLABLE	DEFAULT
id	number	4				
loc_name	varchar2	20			X	
	date					
address	varchar2	30				
city	varchar2	20				
zip_postal	varchar2	20			X	
phone	varchar2	15			X	
email	varchar2	80			X	
manager_id	number	4			X	
contact	varchar2	40			X	

create table global_locations (

id NUMBER(4),
name VARCHAR2(20) NOT NULL,
date_opened DATE NOT NULL,
address VARCHAR2(80) NOT NULL,
city VARCHAR2(20) NOT NULL,
zip_postal VARCHAR2(20),
phone NUM(10),
email VARCHAR2(80) NOT NULL,
Manager_id NUMBER(4),
CONSTRAINT PK_global_locations_id PRIMARY KEY(id),
CONSTRAINT UQ_email UNIQUE(email));

constraint
UQ_global_locations_email UNIQUE
email);

CONSTRAINT PK_global_locations_id PRIMARY KEY(id),
CONSTRAINT UQ_email UNIQUE(email));

PRIMARY KEY, FOREIGN KEY, and CHECK Constraints

- What is the purpose of a
 - PRIMARY KEY - it uniquely identifies each record in a table, not null.
 - FOREIGN KEY - it is used to link two table values.
 - CHECK CONSTRAINT - it is used to limit the range of values that can be stored in a column.
- Using the column information for the animals table below, name constraints where applicable at the table level, otherwise name them at the column level. Define the primary key (animal_id). The license_tag_number must be unique. The admit_date and vaccination_date columns cannot contain null values.

animal_id NUMBER(6) → primary key
 name VARCHAR2(25)
 license_tag_number NUMBER(10) → UNIQUE
 admit_date DATE → NOT NULL
 adoption_id NUMBER(5),
 vaccination_date DATE → NOT NULL

- Create the animals table. Write the syntax you will use to create the table

```

CREATE TABLE animals(
    animal_id NUMBER(6) CONSTRAINT
    Pk_animal PRIMARY KEY,
    name VARCHAR2(25),
    license_tag_number NUMBER(10),
    CONSTRAINT
    license_tag_number UNIQUE,
    admit_date DATE CONSTRAINT
    nn_admit_date NOT NULL,
    adoption_id NUMBER,
    vaccination_date DATE CONSTRAINT
    NOT NULL;
            
```
- Enter one row into the table. Execute a SELECT * statement to verify your input. Refer to the graphic below for input.

ANIMAL_ID	NAME	LICENSE_TAG_NUMBER	ADMIT_DATE	ADOPTION_ID	VACCINATION_DATE
101	Spot	35540	10-Oct-2004	205	12-Oct-2004

INSERT INTO animals (animal_id, name, license_tag_number, admit_date, adoption_id, vaccination_date) VALUES
 ('101', 'spot', 35540, '10-OCT-2004', 205, '12-OCT-2004');
 SELECT * FROM animals;

- Write the syntax to create a foreign key (adoption_id) in the animals table that has a corresponding primary-key reference in the adoptions table. Show both the column-level and table-level syntax. Note that because you have not actually created an adoptions table, no adoption_id primary key exists, so the foreign key cannot be added to the animals table.

CREATE TABLE animals (animal_id NUMBER(6) PRIMARY KEY,
 name VARCHAR2(25),
 license_tag_number NUMBER(10) UNIQUE,
 admit_date DATE NOT NULL,
 adoption_id NUMBER(5) REFERENCES adoptions(adop_id);

6. What is the effect of setting the foreign key in the ANIMAL table as:

- a. ON DELETE CASCADE
- b. ON DELETE SET NULL

will also be deleted automatically.

7. What are the restrictions on defining a CHECK constraint?

- 1. CHECK CONSTRAINT can only refer to column within same table - it cannot refer to others.
- 2. It can't include subqueries.
- 3. It must be boolean expression that evaluates to TRUE or FALSE.

Evaluation Procedure	Marks awarded
Query(5)	5
Execution (5)	5
Viva(5)	5
Total (15)	15
